

1    **ABSTRACT OF THE DISCLOSURE**

2           A transmission device for a 2D image display module includes a securing  
3    member for securing the backboard and the lens,  
4           a programmable step motor adapted to be mounted on the bottom face of the  
5    box for driving the backboard to move relative to the lens;  
6           whereby the backboard is able to be moved in a pre-programmed manner such  
7    that images in the 2D image display module are able to be presented in a desired manner.
